

City Profile: İstanbul, Turkey

ISTANBUL: The City on Two Continents	
Location (Country, Region)	Turkey, Marmara Region (straddling Europe and Asia)
Position (Coordinates)	41.0082° N, 28.9784° E
Population	Approx. 15.84 million (Making it one of the largest cities in Europe)
	
Short Description	*I present İstanbul because it is my home city and a truly unique global hub where history, culture, and two continents meet.* Its strategic position has made it the capital of the Roman, Byzantine, and Ottoman Empires, making it a place of profound historical importance.

40        
41        
42      </td>
43    </tr>
44  </table>
```

In this exercise, I created a table presenting the city profile of Istanbul, starting with a basic HTML table structure. In Stage 1, I applied inline styling to each cell, changing visual properties such as font size, font style, text color, background color, and text decorations while keeping layout dimensions unchanged. This allowed me to practice basic formatting and explore how individual visual styles affect the table's appearance. In Stage 2, I converted all inline styles into external CSS, organizing the styles into class-based selectors to ensure consistency and maintainability. This approach separated content from presentation, improved readability, and made the table easier to maintain, demonstrating the differences and advantages of inline versus external styling.

42      </td>
43    </tr>
44  </table>
```

Ln 1, Col 1 Spaces: 4 UTF-8 LF () HTML Finish Setup

In the Stage 1 version of the table, I applied inline styling to enhance its visual presentation. Each cell was modified with different visual properties such as font family, font size, font style, text color, background color, text alignment, borders, and border radius. These changes focused solely on appearance without affecting the layout or structure of the table. This exercise allowed me to practice applying individual visual styles directly to HTML elements and observe how these modifications impact readability and aesthetics.

40   padding: 8px;
41 }
42
43 /* Specific visual styles */
44 .iteration-4-color { color: #darkred; font-weight: bold; }

```

In Stage 2, I converted all inline styles from the table into an external CSS file. Each visual property was organized into class-based selectors to ensure consistency and maintainability, separating content from presentation. This approach allowed me to reuse styles across multiple elements, reduce code repetition, and make future updates easier. The table now retains all visual enhancements from the inline-styled version—such as font styles, colors, text decorations, background colors, and image borders—while achieving a cleaner and more structured codebase.
